

# Lab 5

## Question 2

**Disclaimer:** I had some problems while trying to compile and run the program. Hereby I leave some screenshots and commands used so you can replicate the results.

- I'm using ubuntu 20.04
- I installed the openmpi-bin and libopenmpi-dev packages for Debian based systems as requested.
- To compile I used `mpicc ex2.c -o ex2` and it worked perfectly.
- When trying to run the program with the suggested command `mpirun -np 7 ./ex2` the following occurred

```
vitorhugo13@vitorhugo13-X556URK:~/Desktop/Faculdade/PDP/Lab5$ mpirun -np 7 ./ex2
```

```
Invalid MIT-MAGIC-COOKIE-1 key-----  
There are not enough slots available in the system to satisfy the 7  
slots that were requested by the application:
```

```
./ex2
```

```
Either request fewer slots for your application, or make more slots  
available for use.
```

```
A "slot" is the Open MPI term for an allocatable unit where we can  
launch a process. The number of slots available are defined by the  
environment in which Open MPI processes are run:
```

1. Hostfile, via "slots=N" clauses (N defaults to number of processor cores if not provided)
2. The `--host` command line parameter, via a ":N" suffix on the hostname (N defaults to 1 if not provided)
3. Resource manager (e.g., SLURM, PBS/Torque, LSF, etc.)
4. If none of a hostfile, the `--host` command line parameter, or an RM is present, Open MPI defaults to the number of processor cores

```
In all the above cases, if you want Open MPI to default to the number  
of hardware threads instead of the number of processor cores, use the  
--use-hwthread-cpus option.
```

```
Alternatively, you can use the --oversubscribe option to ignore the  
number of available slots when deciding the number of processes to  
launch.
```

- As suggested I created an hostfile file indicating the number of slots to be available
- After compiling again and use `mpirun --hostfile hostfile -np 7 ./ex2` to run the code, I was able to check how the program works

```
vitorhugo13@vitorhugo13-X556URK:~/Desktop/Faculdade/PDP/Lab5$ mpirun --hostfile hostfile -np 7 ./ex2
```

```
Invalid MIT-MAGIC-COOKIE-1 keyData to process 4 recieved from 0 on vitorhugo13-X556URK  
Data to process 5 recieved from 0 on vitorhugo13-X556URK  
Data to process 2 recieved from 0 on vitorhugo13-X556URK  
Data to process 6 recieved from 0 on vitorhugo13-X556URK  
Data to process 1 recieved from 0 on vitorhugo13-X556URK  
Data to process 3 recieved from 0 on vitorhugo13-X556URK
```

## Question 3

---

- Output of the program can be seen in image below.

```

vitorhugo13@vitorhugo13-X556URK:~/Desktop/Faculdade/PDP/Lab5$ mpicc ex3.c -o ex3
vitorhugo13@vitorhugo13-X556URK:~/Desktop/Faculdade/PDP/Lab5$ mpirun --hostfile hostfile -np 7 ./ex3
Invalid MIT-MAGIC-COOKIE-1 key
Enter a number:
3
Process 0 got a 3
Process 1 got 3 from process 0
Process 2 got 3 from process 1
Process 3 got 3 from process 2
Process 4 got 3 from process 3
Process 5 got 3 from process 4
Process 6 got 3 from process 5
Process 0 got 3 from process 6

Enter a number:
4
Process 0 got a 4
Process 1 got 4 from process 0
Process 2 got 4 from process 1
Process 3 got 4 from process 2
Process 4 got 4 from process 3
Process 5 got 4 from process 4
Process 6 got 4 from process 5
Process 0 got 4 from process 6

Enter a number:
-1
Process 1 got -1 from process 0
Process 0 got a -1
Process 2 got -1 from process 1
Process 3 got -1 from process 2
Process 4 got -1 from process 3
Process 5 got -1 from process 4
Process 6 got -1 from process 5
Process 0 got -1 from process 6
vitorhugo13@vitorhugo13-X556URK:~/Desktop/Faculdade/PDP/Lab5$
```

- As in exercise 2, I created an hostfile file indicating the number of slots to be available. (this number can be varied in order to test the program with more ranks instead of only 7).

## Question 4

---

- For this question I'll be using the information present here [https://delta.pk.edu.pl/pluginfile.php/91736/mod\\_resource/content/2/PaDP\\_Lecture\\_6.pdf](https://delta.pk.edu.pl/pluginfile.php/91736/mod_resource/content/2/PaDP_Lecture_6.pdf) , particularly slides 9 and 10.
- In a nutshell, it was necessary to replace the functions MPI\_Recv by MPI\_Irecv and MPI\_Send by MPI\_Isend. In the new functions, the last argument &value was replaced by &request. After MPI\_Irecv it was also needed to call MPI\_Wait.
- To test the program I run the same commands as the ones present in exercise 3.
